Instruction to Use Java Maven Project

Your project has the following **standard project structure** under the root**:**

```
my-app
|-- pom.xml
`-- src
    |-- main
    |   `-- java
    |       `-- com
    |           `-- mycompany
    |               `-- app
    |                   `-- App.java
    `-- test
        `-- java
            `-- com
                `-- mycompany
                    `-- app
                        `-- AppTest.java
```

If you want to create any other project structure then you can use the following command from command prompt:

```
mvn archetype:generate –DgroupId=com.mycompany.app –DartifactId=my-
app –DarchetypeArtifactId=maven-archetype-quickstart –
DinteractiveMode=false
```

Accordingly, you will have to change compilation options using **Project → Compile Options.**
